Professional Summary

Platform Engineer with production experience building **Internal Developer Platforms that reduce new service onboarding from 2 weeks to under 15 minutes** through self-service Golden Paths, GitOps-driven delivery, and Crossplane-backed infrastructure provisioning.
Treats platforms as internal products: **standardizing software delivery through shared CI/CD templates and progressive delivery**, automating infrastructure through declarative self-service, and **embedding shift-left security and policy governance by default** so developers inherit compliance without friction.
Strong Go engineering background with production experience building **custom Kubernetes controllers, platform orchestration APIs, and cloud-native tooling on AWS EKS.**

Core Competencies

Platform Engineering IDPs, Platform as a Product, Golden Paths, Self-Service Platforms, Platform APIs, Developer Experience (DevEx), Multi-Tenant Platforms

Cloud & Infrastructure AWS (EKS, RDS, ElastiCache, S3, SQS, DynamoDB, IAM, Route53), Kubernetes, Docker, Terraform, Helm, Crossplane

GitOps & Delivery ArgoCD (ApplicationSets, AppProjects), Argo Rollouts, GitHub Actions, Progressive Delivery, Shared CI/CD Templates, Release Engineering

Security & Governance Shift-Left Security, HashiCorp Vault, Kyverno, Cosign, Trivy, OPA/Conftest, Checkov, RBAC, OIDC, IRSA, Policy as Code

Observability Prometheus, Grafana, Loki, Alertmanager, OpenTelemetry, SLOs, Error Budgets, Runtime Visibility, Audit Trails

Backend Engineering Go, Node.js, TypeScript, REST APIs, controller-runtime, kubebuilder, GitHub API Integration, PostgreSQL, Redis

FinOps & Reliability Infracost, Cost Allocation Tags, Velero, Istio, RPO/RTO Planning, Incident Management

Professional Experience

Platform Engineer / Technical Lead **2024 – Present**
ICT Slides – Early-stage EdTech company, sole platform function *Anambra State, Nigeria*

- Designed and delivered an **Internal Developer Platform with reusable Golden Path templates that reduced new service onboarding from 2 weeks to under 15 minutes**. The platform scaffolds production-ready repositories complete with CI/CD pipelines, GitOps structure, Helm charts, rollout strategy, security defaults, and environment overlays, enabling developers to create and own services without Kubernetes or AWS expertise.
- Built **platform orchestration APIs that automated repository creation, release management, and infrastructure provisioning while reducing monthly infrastructure tickets from 20+ to zero**. Implemented in Go and Node.js, the Platform API integrates with GitHub to automate repository creation, environment promotion, and repeatable platform workflows.
- Architected a *guardrails-not-gates* **software delivery system that standardized delivery across 50+ microservices while reducing deployment failures by 40%**. Shared CI/CD pipeline templates, ArgoCD, and Argo Rollouts route every deployment, promotion, and rollback through GitHub Pull Requests, making the safest delivery path the default for every engineering team.
- Built **custom Kubernetes controllers that reduced environment provisioning from 15 minutes and 6 manual `kubectl` operations to under 30 seconds**. Using controller-runtime and kubebuilder, the controllers automate namespace provisioning, RBAC, ResourceQuotas, LimitRanges, and NetworkPolicies through declarative `TeamEnvironment` resources, extending Kubernetes with platform-specific automation for self-service platform operations.
- Implemented **self-service infrastructure provisioning with full GitOps auditability and zero manual cloud console access**. Developers request PostgreSQL, Redis, S3, SQS, and DynamoDB through declarative platform workflows; the Platform API opens a GitHub PR, ArgoCD syncs Crossplane claims, and AWS resources are provisioned with enforced encryption, private networking, and FinOps cost-allocation tags.
- Embedded **shift-left security and policy governance as first-class platform capabilities**. Cosign image signing is enforced through Kyverno, Trivy blocks high-severity CVEs in CI, OPA/Conftest validates Terraform compliance before apply, and HashiCorp Vault injects dynamic secrets through OIDC, enabling engineering teams to ship securely by default.
- Drove **platform reliability by reducing incident MTTR from 2 hours to 1 hour and MTTD by 40%**. Defined SLOs and error budgets with product teams, then built a unified observability portal aggregating runtime health, deployment status, ArgoCD sync state, and Kyverno policy violations into a single developer-facing interface.
- Extended Kubernetes with idempotent reconciliation, GitOps-aware deployment gates, and least-privilege operator automation. The controller implements exponential backoff, emits a `TeamReady` status condition consumed by ArgoCD ApplicationSets as a pre-sync hook, and is packaged as a Helm chart managed through the same GitOps pipeline it serves.

Key Projects

Nexus Platform – Internal Developer Platform | nexus-idp-web.vercel.app
Next.js · Go · Node.js · Kubernetes · AWS · ArgoCD · Crossplane · Vault · Kyverno · Istio · Argo Rollouts

- Built a **self-service developer platform** that enables engineers to authenticate, create production-ready services from Golden Path templates, provision cloud infrastructure, and manage the complete software delivery lifecycle – without needing Kubernetes, ArgoCD, Helm, Crossplane, or AWS expertise. The platform handles operational complexity; developers focus on product work.
- Implemented **Golden Path service creation**: a single "Create Service" action triggers a Platform API that calls the GitHub API to generate a repository and commit standardized CI/CD workflows, Helm charts, GitOps manifests, rollout strategy, security defaults, and environment overlays automatically – developers never configure delivery infrastructure from scratch.
- Delivered a **Release Management console** exposing the full delivery lifecycle – deployment history, promotion workflows, canary rollout progress, rollback triggers, GitHub Actions CI status, and ArgoCD sync health – from a single interface, eliminating the need to context-switch across five separate tools per deployment.
- Built end-to-end **self-service infrastructure provisioning**: developers submit a resource request through the platform; the Platform API creates a Crossplane claim via a GitHub PR; ArgoCD syncs the claim; Crossplane provisions the AWS resource (PostgreSQL, Redis, S3, SQS, DynamoDB) with enforced encryption, private networking, and FinOps tags – complete GitOps audit trail, no manual cloud operations required.
- Implemented **progressive delivery** with Argo Rollouts and Istio: canary deployments route 10% of production traffic to new versions, Prometheus AnalysisTemplates evaluate error rate SLOs, and automatic rollback fires if the error rate exceeds 5% – zero-downtime deployments with data-driven promotion gates across all production services.

TeamEnvironment Operator – Custom Kubernetes Controller for Nexus Platform | Live Demo
Go · controller-runtime · kubebuilder · Kubernetes · AWS EKS · Helm · ArgoCD

- Designed and built a **custom Kubernetes controller** in Go using controller-runtime and kubebuilder: a single `TeamEnvironment` CRD submission automatically provisions a dedicated namespace, RBAC roles and bindings, ResourceQuotas, LimitRanges, and NetworkPolicies – completing in **under 30 seconds** what previously required 6 manual `kubectl` steps and 15 minutes of platform team time.
- Implemented a **fully idempotent reconciliation loop** with exponential backoff, structured error handling, and typed status conditions – the controller safely re-reconciles on any partial failure, guaranteeing cluster state always converges to the declared spec without duplicate resources or orphaned objects.
- Built an **ArgoCD sync gate**: the operator emits a `TeamReady` status condition consumed by ArgoCD ApplicationSets as a pre-sync hook – no application deploys into a namespace until the operator confirms all RBAC, quota, and NetworkPolicy resources are provisioned and healthy.
- Packaged as a **Helm chart deployed via ArgoCD** – the operator is managed through the same GitOps pipeline it serves, with ClusterRole permissions scoped to only the resource types it manages (least-privilege operator pattern).

Education

Chukwuemeka Odumegwu Ojukwu University **2020 – 2024**
B.Sc. Computer Science *Anambra State, Nigeria*

ALX Africa **2023 – 2024**
Software Engineering Fellowship

Certifications & Training

- **Certified Kubernetes Administrator (CKA)** – *Expected Q3 2026*
- **AWS Certified Solutions Architect – Associate** – *Expected Q4 2026*
- HashiCorp Vault Operations – Training Completed
- Istio Service Mesh Fundamentals – Training Completed
